Inspection Checklist for NIH BL2 Laboratories (7 CFR 331; 9 CFR 121; 42 CFR 73; NIH Guidelines)
Inspection Date:
Entity Name:
Responsible Official:
SAP Inspector(s):
Principal Investigator (P.I.):
Laboratory Location - Street Address:
Building:
Room number(s):
Agent(s)/Toxin(s):
When Information is entered in this form, the form is to be considered "Sensitive Select Agent Information."

Reference	Statement		No			Comments			
	NIII DI O								
	NIH BL2 (rDNA) Requirements								
CFR: Section 12(a)	An individual or entity required to register under this part must develop and implement a written biosafety plan that is commensurate with the risk of the agent of toxin, given its intended use.	o							
CFR: Section 12(a)	The biosafety plan must contain sufficient information and documentation to describe the biosafety and containment procedures.								
CFR: Section 12(b)	The biosafety and containment procedures must be sufficient to contain the select agent or toxin (e.g., physical structure and features of the entity, and operational ar procedural safeguards).	10							
<b>CFR</b> : Section 12 (c)(3)	In developing a biosafety plan, an individual or entity should consider: The "NIH Guidelines for Research Involving Recombinant DNA Molecules," (NIH Guidelines) Copies may be obtained from the Centers for Disease Control and Prevention, 160 Clifton Road, Mail Stop E-79, Atlanta, Georgia, 30333 or from the CDC web site at http://www.cdc.gov/. Copies may be inspected at the Centers for Disease Control and Prevention, 1600 Clifton Road, Mail Stop E-79, Atlanta, Georgia.								
CFR: Section 12(d)	The plan must be reviewed annually and revised as necessary.								
CFR: Section 12(d)	Drills or exercises must be conducted at least annually to test and evaluate the effectiveness of the plan.								
CFR: Section 12(d)	The plan must be reviewed and revised, as necessary, after any drill or exercise and after any incident.								
CFR: Section 13 (a)	An individual or entity may not conduct a restricted experiment with a HHS select agent or toxin unless approved by and conducted in accordance with any condition prescribed by the HHS Secretary.	s							
CFR: Section 13 (a)	In addition, an individual or entity may not conduct a restricted experiment with an overlap select agent or toxin unless approved by and conducted in accordance with any conditions prescribed by the HHS Secretary, after consultation with Administrator.	1							
<b>CFR</b> : Section 13 (b)(1)	Restricted experiments: Experiments utilizing recombinant DNA that involve the deliberate transfer of a drug resistance trait to select agents that are not known to acquire the trait naturally, if such acquisition could compromise the use of the drug to control disease agents in humans, veterinary medicine, or agriculture.								
CFR: Section 13 (b)(2)	Restricted experiments: Experiments involving the deliberate formation of recombinant DNA containing genes for the biosynthesis of select toxins lethal for vertebrates at an LD50 < 100 ng/kg body weight.								
Α									
NIH: G-II: B-1-a	Access to the laboratory is limited or restricted by the Principal Investigator when work with organisms containing recombinant DNA molecules is in progress.								

		Response			
Reference	Statement	Yes No N/A			Comments
NIH: G-II: B-1-b	Work surfaces are decontaminated at least once a day and after any spill of viable material.				
NIH: G-II: B-1-c	All contaminated liquid or solid wastes are decontaminated before disposal.				
NIH: G-II: B-1-d	Mechanical pipetting devices are used; mouth pipetting is prohibited.				
NIH: G-II: B-1-e	Eating, drinking, smoking, and applying cosmetics are not permitted in the work area.				
NIH: G-II: B-1-e	Food may be stored in cabinets or refrigerators designated and used for this purpose only.				
NIH: G-II: B-1-f	Persons wash their hands: (i) after handling materials involving organisms containing rDNA molecules and animals, and (ii) when exiting the laboratory.				
NIH: G-II: B-1-g	All procedures are performed carefully to minimize the creation of splashes or aerosols.				
NIH: G-II: B-1-h	Experiments of lesser biohazard potential can be conducted concurrently in carefull demarcated areas of the same laboratory.				
В					
NIH: G-II: B-2-a	Contaminated materials that are to be decontaminated at a site away from the laboratory are placed in a durable leak-proof container which is closed before being removed from the laboratory.				
NIH: G-II: B-2-b	The Principal Investigator limits access to the laboratory. The Principal Investigator has the final responsibility for assessing each circumstance and determining who may enter or work in the laboratory.				
NIH: G-II:B-2-c	The Principal Investigator establishes policies and procedures whereby only persons who have been advised of the potential hazard and meet any specific entry requirements (e.g., immunization) may enter the laboratory or animal rooms.	,			
NIH: G-II: B-2-d	When the organisms containing rDNA molecules in use in the laboratory require special provisions for entry (e.g., vaccination), a hazard warning sign incorporating the universal biosafety symbol is posted on the access door to the laboratory work area.				
NIH: G-II: B-2-d	The hazard warning sign identifies the agent, lists the name and telephone number of the Principal Investigator or other responsible person(s), and indicates the special requirement(s) for entering the laboratory.	l			
NIH: G-II: B-2-e	An insect and rodent control program is in effect.				
NIH: G-II: B-2-f	Laboratory coats, gowns, smocks, or uniforms are worn while in the laboratory.				
NIH: G-II: B-2-f	Before exiting the laboratory for non-laboratory areas (e.g., cafeteria, library, administrative offices), this protective clothing is removed and left in the laboratory or covered with a clean coat not used in the laboratory.				
NIH: G-II: B-2-g	Animals not involved in the work being performed are not permitted in the laboratory.				
NIH: G-II: B-2-h	Special care is taken to avoid skin contamination with organisms containing recombinant DNA molecules.				
NIH: G-II: B-2-h	Gloves should be worn when handling experimental animals and when skin contact with the agent is unavoidable.				
NIH: G-II: B-2-i	All wastes from laboratories and animal rooms are appropriately decontaminated before disposal.
